## libximc library

Documentation for libximc library.

Libximc is **thread safe**, cross-platform library for working with 8SMC4-USB and 8SMC5-USB controllers.

Full documentation about controllers is [there](#)

Full documentation about libximc API is available on the page [ximc.h](#).

### 1.1 What the controller does.

- Supports input and output synchronization signals to ensure the joint operation of multiple devices within a complex system ;.
- Works with all compact stepper motors with a winding current of up to 3 A, without feedback, as well as with stepper motors equipped with an encoder in the feedback circuit, including a linear encoder on the positioner.
- Manages hardware using ready-made software or using libraries for programming languages: C / C ++, C #, JAVA, Visual Basic, Python 2/3, .NET, Delphi, integration with MS Visual Studio programming environments, gcc, Xcode.
- Works with scientific development environments by integrating LabVIEW and MATLAB;

### 1.2 What can do libximc library

- Libximc manages hardware using interfaces: USB 2.0., RS232 and Ethernet, also uses a common and proven virtual serial port interface, so you can work with motor control modules through this library under almost all operating systems, including Windows, Linux and Mac OS X
- Libximc library supports plug/unplug on the fly. Each device can be controlled only by one program at once. Multiple processes (programs) that control one device simultaneously are not allowed.

#### Warning

Libximc library opens the controller in exclusive access mode. Any controller opened with libximc (XiLab also uses this library) needs to be closed before it may be used by another process. So at first check that you have closed XiLab or other software dealing with the controller before trying to reopen the controller.

Please read the [Introduction](#) to start work with library.

To use libximc in your project please consult with [How to use with...](#)

## 1.3 Assistance.

Many thanks to everyone who sends suggestions, errors and ideas. We appreciate your suggestions and try to make our product better. Please post your questions [here](#). Your ideas and comments send a e-mail: [8smc4@standa.lt](mailto:8smc4@standa.lt)

# How to rebuild library

### 3.1 Building on generic UNIX

Generic version could be built with standard autotools.

```
./build.sh lib
```

Built files (library, headers, documentation) are installed to `./dist/local` directory. It is a generic developer build. Sometimes you need to specify additional parameters to command line for your machine. Please look to following OS sections.

### 3.2 Building on debian-based linux systems

Requirement: 64-bit and 32-bit debian system, ubuntu Typical set of packages: gcc, autotools, autoconf, libtool, dpkg-dev, flex, libfl-dev, bison, doxygen, texlive, mercurial Full set of packages: apt-get install ruby1.9.1 debhelper vim sudo g++ mercurial git curl make cmake autotools-dev automake autoconf libtool default-jre-headless default-jdk openjdk-6-jdk dpkg-dev lintian texlive texlive-latex-extra texlive-lang-cyrillic dh-autoreconf hardening-wrapper bison flex libfl-dev doxygen lsb-release pkg-config check For ARM cross-compiling install gcc-arm-linux-gnueabi from your ARM toolchain.

It's required to match library and host architecture: 64-bit library can be built only at 64-bit host, 32-bit library - only at 32-bit host. ARM library is built with armhf cross-compiler gcc-arm-linux-gnueabi.

To build library and package invoke a script:

```
$ ./build.sh libdeb
```

For ARM library replace 'libdeb' with 'libdebarm'.

Grab packages from `./ximc/deb` and locally installed binaries from `./dist/local`.

### 3.3 Building on redhat-based linux systems

Requirement: 64-bit redhat-based system (Fedora, Red Hat, SUSE) Typical set of packages: gcc, autotools, autoconf, libtool, flex, libfl-dev, bison, doxygen, texlive, mercurial Full set of packages: autoconf automake bison doxygen flex libfl-dev gcc gcc-32bit gcc-c++ gcc-c++-32bit java-1.7.0-openjdk java-1.7.0-openjdk-devel libtool lsb-release make mercurial rpm-build rpm-devel rpmlint texlive texlive-fonts-extra texlive-latex

It's possible to build both 32- and 64-bit libraries on 64-bit host system. 64-bit library can't be built on 32-bit system.

To build library and package invoke a script:

```
$ ./build.sh librpm
```

Grab packages from `./ximc/rpm` and locally installed binaries from `./dist/local`.

## 3.4 Buliding on Mac OS X

To build and package a script invoke a script:

```
$ ./build.sh libosx
```

Built library (classical and framework), examples (classical and `.app`), documentation are located at `./ximc/macosex`, locally installed binaries from `./dist/local`.

## 3.5 Buliding on Windows

Requirements: 64-bit windows (build script builds both architectures), cygwin (must be installed to a default path), mercurial.

Invoke a script:

```
$ ./build.bat
```

Grab packages from `./deb/win32` and `./deb/win64`

To build debug version of the library set environment variable "DEBUG" to "true" before running the build script.

## 3.6 Source code access

XIMC source codes are given under special request.

## Chapter 4

# How to use with...

Library usage can be examined from test application testapp. Non-C languages are supported because library supports stdcall calling convention and so can be used with a variety of languages.

C test project is located at 'examples/testapp' directory, C# test project - at 'examples/test\_CSharp', VB.NET - 'examples/test\_VBNET', Delphi 6 - 'examples/test\_Delphi', sample bindings for MATLAB - 'examples/test\_MATLAB', for Java - 'examples/test\_Java', for Python - 'examples/test\_Python'. Development kit also contains precompiled examples: testapp and testappeasy as 32 and 64-bit applications for Windows and 64-bit application for osx, test\_CSharp, test\_VBNET, test\_Delphi - 32-bit only, test\_Java is architecture-independent, test\_MATLAB and test\_Python are runtime-interpreted.

NOTE: SDK requires Microsoft Visual C++ Redistributable Package (provided with SDK - vc\_redist.x86 or vc\_redist.x64)

NOTE: On Linux both the libximc7\_x.x.x and libximc7-dev\_x.x.x target architecture in the specified order. For install packages, you can use the `dpkg -i filename.deb` command, where filename.deb is the name of the package (packages in Debian have the extension .deb). You must run dpkg with superuser privileges (root).

### 4.1 Usage with C

#### 4.1.1 Visual C++

Testapp can be built using testapp.sln. Library must be compiled with MS Visual C++ too, mingw-library isn't supported. Make sure that Microsoft Visual C++ Redistributable Package is installed.

Open solution examples/testapp/testapp.sln, build and run from the IDE.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.c file before build (see `enumerate_hints` variable).

#### 4.1.2 CodeBlocks

Testapp can be built using test\_CodeBlocks.cbp. Library must be compiled with MS Visual C++ too, mingw-library isn't supported. Make sure that Microsoft Visual C++ Redistributable Package is installed. \*

Open solution examples/test\_CodeBlocks/test\_CodeBlocks.cbp, build and run from the IDE.

#### 4.1.3 MinGW

MinGW is a port of GCC to win32 platform. It's required to install MinGW package. Currently not supported

MinGW-compiled testapp can be built with MS Visual C++ or mingw library.

```
$ mingw32-make -f Makefile.mingw all
```

Then copy library libximc.dll to current directory and launch testapp.exe.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.c file before build (see enumerate\_hints variable).

#### 4.1.4 C++ Builder

First of all you should create C++ Builder-style import library. Visual C++ library is not compatible with BCB. Invoke:

```
$ implib libximc.lib libximc.def
```

Then compile test application:

```
$ bcc32 -I..\..\ximc\win32 -L..\..\ximc\win32 -DWIN32 -DNDEBUG -DWINDOWS  
testapp.c libximc.lib
```

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.c file before build (see enumerate\_hints variable).

#### 4.1.5 XCode

Test app should be built with XCode project testapp.xcodeproj. Library is a Mac OS X framework, and at example application it's bundled inside testapp.app

Then launch application testapp.app and check activity output in Console.app.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.c file before build (see enumerate\_hints variable).

#### 4.1.6 GCC

Make sure that libximc (rpm, deb, freebsd package or tarball) is installed at your system. Installation of package should be performed with a package manager of operating system. On OS X a framework is provided.

Note that user should belong to system group which allows access to a serial port (dip or serial, for example).

Copy file /usr/share/libximc/keyfile.sqlite project directory:

```
$ cp /usr/share/libximc/keyfile.sqlite .
```

Test application can be built with the installed library with the following script:

```
$ make
```

In case of cross-compilation (target architecture differs from the current system architecture) feed -m64 or -m32 flag to compiler. On OS X it's needed to use -arch flag instead to build an universal binary. Please consult a compiler documentation.

Then launch the application as:

```
$ make run
```

Note: make run on OS X copies a library to the current directory. If you want to use library from the custom directory please be sure to specify LD\_LIBRARY\_PATH or DYLD\_LIBRARY\_PATH to the directory with the library.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.c file before build (see enumerate\_hints variable).

## 4.2 .NET

Wrapper assembly for libximc.dll is wrappers/csharp/ximcnet.dll. It is provided with two different architectures. Supports the platform .NET from 2.0. to 4.0.

Test .NET applications for Visual Studio 2013 is located at test\_CSharp (for C#) and test\_VBNET (for VB.NET) respectively. Open solutions and build.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testapp.cs or testapp.vb file (depending on programming language) before build (see enumerate\_hints variable for C# or enum\_hints variable for VB).

## 4.3 Delphi

Wrapper for libximc.dll is a unit wrappers/delphi/ximc.pas

Console test application for is located at test\_Delphi. Tested with Delphi 6 and only 32-bit version.

Just compile, place DLL near the executable and run program.

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in test\_Delphi.dpr file before build (see enum\_hints variable).

## 4.4 Java

How to run example on Linux. Navigate to ximc-2.x.x./examples/test\_Java/compiled/ and run:

```
$ cp /usr/share/libximc/keyfile.sqlite .
$ java -cp /usr/share/java/libjximc.jar:test_Java.jar ru.ximc.TestJava
```

How to run example on Windows or Mac. Navigate to ximc-2.x.x./examples/test\_Java/compiled/. Copy contents of ximc-2.x.x/ximc/win64 or ximc-2.x.x/ximc/macosx accordingly to the current directory. Then run:

```
$ java -classpath libjximc.jar -classpath test_Java.jar ru.ximc.TestJava
```

How to modify and recompile an example. Navigate to examples/test\_Java/compiled. Sources are embedded in a test\_Java.jar. Extract them:

```
$ jar xvf test_Java.jar ru META-INF
```

Then rebuild sources:

```
$ javac -classpath /usr/share/java/libjximc.jar -Xlint ru/ximc/TestJava.java
```

or for windows or mac

```
$ javac -classpath libjximc.jar -Xlint ru/ximc/TestJava.java
```

Then build a jar:

```
$ jar cmf META-INF/MANIFEST.MF test_Java.jar ru
```

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in TestJava.java file before build (see ENUM\_HINTS variable).

## 4.5 Python

Change current directory to the examples/test\_Python. For correct usage of the library libximc, the example uses the file wrapper, crossplatform\wrappers\python\pyximc.py with a description of the structures of the library.

Before launch:

On OS X: copy library ximc/macosx/libximc.framework to the current directory.

On Linux: you may need to set LD\_LIBRARY\_PATH so Python can locate libraries with RPATH. For example, you may need:

```
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH: 'pwd'
```

On Windows before the start nothing needs to be done. All necessary communication and dependencies are registered in the example code. Libraries used: bindy.dll libximc.dll xiwrapper.dll. Located in the folder for the respective versions of Windows.

Launch Python 2 or Python 3:

```
python test_Python.py
```

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in test\_Python.py file before launch (see enum\_hints variable).

## 4.6 MATLAB

Sample MATLAB program testximc.m is provided at the directory examples/test\_MATLAB. On windows copy [ximc.h](#), libximc.dll, bindy.dll, xiwrapper.dll and contents of ximc/(win32,win64)/wrappers/matlab/ directory to the current directory.

Before launch:

On OS X: copy ximc/macosx/libximc.framework, ximc/macosx/wrappers/ximcm.h, ximc/ximc.h \* to the directory examples/matlab. Install XCode compatible with Matlab.

On Linux: install libximc\*deb and libximc-dev\*dev of target architecture. Then copy ximc/macosx/wrappers/ximcm.h to the directory examples/matlab. Install gcc compatible with Matlab.

For XCode and gcc version compability check document <https://www.mathworks.com/content/dam/mathworks/mathworks/SystemRequirements-Release2014a-SupportedCompilers.pdf> or similar.

On Windows before the start nothing needs to be done

Change current directory in the MATLAB to the examples/matlab. Then launch in MATLAB prompt:

```
testximc
```

In case of the 8SMC4-USB-Eth1 Ethernet adapter usage it is necessary to set correct IP address of the Ethernet adapter in testximc.m file before launch (see enum\_hints variable).

## 4.7 Generic logging facility

If you want to turn on file logging, you should run the program that uses libximc library with the "XILog" environment variable set to desired file name. This file will be opened for writing on the first log event and will be closed when the program which uses libximc terminates. Data which is sent to/received from the controller is logged along with port open and close events.

## 4.8 Required permissions

libximc generally does not require special permissions to work, it only needs read/write access to USB-serial ports on the system. An exception to this rule is a Windows-only "fix\_usbser\_sys()" function - it needs elevation and will produce null result if run as a regular user.

## 4.9 C-profiles

C-profiles are header files distributed with the libximc library. They enable one to set all controller settings for any of the supported stages with a single function call in a C/C++ program. You may see how to use C-profiles in "testcprofile" example directory.

## Chapter 5

# Working with custom units

In addition to working in basic units(steps, encoder value), the library allows you to work with custom units. For this purpose are used:

- The structure of the conversion units [calibration\\_t](#)
- The functions of which have doubles for working with custom units, data structures for these functions
- Coordinate correction table for more accurate positioning

### 5.1 The structure of the conversion units `calibration_t`

To specify conversion of the basic units in the user and back, [calibration\\_t](#) structure is used. With the help of coefficients A and MicrostepMode, specified in this structure, steps and microsteps which are integers are converted into the user value of the real type and back.

Conversion formulas:

- The conversion to user units.

```
user_value = A*(step + mstep/pow(2, MicrostepMode-1))
```

- Conversion from custom units.

```
step = (int)(user_value/A)
mstep = (user_value/A - step)*pow(2, MicrostepMode-1)
```

### 5.2 Alternative functions for working with custom units and data structures for them

Structures and functions for working with custom units have the `_calb` postfix. The user using these functions can perform all actions in their own units without worrying about the computations of the controller. The data format of `_calb` structures is described in detail. For `_calb` functions particular descriptions are not used. They perform the same actions as the basic functions do. The difference between them and the basic functions is in the position, velocity, and acceleration of the data types defined as user-defined. If clarification for `_calb` functions is necessary, they are provided as notes in the description of the basic functions.

## 5.3 Coordinate correction table for more accurate positioning

Some functions for working with custom units support coordinate transformation using a correction table. To load a table from a file, the [load\\_correction\\_table\(\)](#) function is used. Its description contains the functions and their data supporting correction.

### Note

For data fields which are corrected in case of loading of the table in the description of the field is written - corrected by the table.

File format:

- two columns separated by tabs;
- column headers are string;
- real type data, point is a separator;
- the first column is the coordinate, the second is the deviation caused by a mechanical error;
- the deviation between coordinates is calculated linearly;
- constant is equal to the deviation at the boundary beyond the range;
- maximum length of the table is 100 lines.

Sample file:

X	dX
0	0
5.0	0.005
10.0	-0.01

*Minimum contrast steps from step motor encoder position, wich set STATE\_CTP\_ERROR flag.*
- unsigned int [CTPFlags](#)  
*Position control flags.*

### 6.10.1 Detailed Description

Control position settings(is only used with stepper motor).

When controlling the step motor with encoder (CTP\_BASE 0) it is possible to detect the loss of steps. The controller knows the number of steps per revolution (GENG :: StepsPerRev) and the encoder resolution (GFBS :: IPT). When the control (flag CTP\_ENABLED), the controller stores the current position in the footsteps of SM and the current position of the encoder. Further, at each step of the position encoder is converted into steps and if the difference is greater CTPMinError, a flag STATE\_CTP\_ERROR and set ALARM state. When controlling the step motor with speed sensor (CTP\_BASE 1), the position is controlled by him. The active edge of input clock controller stores the current value of steps. Further, at each turn checks how many steps shifted. When a mismatch CTPMinError a flag STATE\_CTP\_ERROR and set ALARM state.

### 6.37.1 Detailed Description

Joystick settings.

This structure contains joystick parameters. If joystick position is outside `DeadZone` limits from the central position a movement with speed, defined by the joystick `DeadZone` edge to 100% deviation, begins. Joystick

positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy.

### 6.58.2 Field Documentation

6.58.2.1 unsigned int Accuracy

This is the neighborhood around the target coordinates, which is getting hit in the target position and the momentum generated by the stop.

6.58.2.2 unsigned int SyncOutFlags

[Flags of synchronization output.](#)

6.58.2.3 unsigned int `SyncOutPeriod`

This value specifies number of encoder pulses or steps between two output synchronization pulses when `SYNCOUT_ONPERIOD` is set.

6.58.2.4 unsigned int `SyncOutPulseSteps`

This value specifies duration of output pulse.

It is measured microseconds when `SYNCOUT_IN_STEPS` flag is cleared or in encoder pulses or motor steps when `SYNCOUT_IN_STEPS` is set.

6.58.2.5 unsigned int `uAccuracy`

This is the neighborhood around the target coordinates in microsteps (only used with stepper motor).

Microstep size and the range of valid values for this field depend on selected step division mode (see `MicrostepMode` field in `engine_settings`).

## Parameters

	<i>id</i>	an identifier of device
	<i>refresh_interval_ms</i>	Status refresh interval. The function waits this number of milliseconds between get_status requests to the controller. Recommended value of this parameter is 10 ms. Use values of less than 3 ms only when necessary - small refresh interval values do not significantly increase response time of the function, but they create substantially more traffic in controller-computer data channel.
<i>out</i>	<i>ret</i>	RESULT_OK if controller has stopped and result of the first get_status command which returned anything other than RESULT_OK otherwise.

7.1.4.25 **result\_t XIMC\_API** command\_zero ( **device\_t** id )

Sets the current position and the position in which the traffic moves by the move command and movr zero for all cases, except for movement to the target position.

In the latter case, set the zero current position and the target position counted so that the absolute position of the destination is the same. That is, if we were at 400 and moved to 500, then the command Zero makes the current position of 0, and the position of the destination - 100. Does not change the mode of movement that is if the motion is carried, it continues, and if the engine is in the "hold", the type of retention remains.

Non-null value is a remote host name or a comma-separated list of host names which contain the devices to be found, absent value means broadcast discovery. adapter_-addr - used together with ENUMERATE_NETWORK flag. Non-null value is a IP address of network adapter. Remote ximc device must be on the same local network as the adapter. When using the adapter_addr key, you must install the addr key. If joystick position is outside DeadZone limits from the central position a movement with speed, defined by the joystick DeadZone edge to 100% deviation, begins. Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where  $i = 0$  by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The DeadZone ranges are illustrated on the following picture.  The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy. The following picture illustrates this:  The nonlinearity parameter is adjustable. Setting it to zero makes deviation/speed relation linear.

Further, at each step of the position encoder is converted into steps and if the difference is greater CTPMinError, a flag STATE\_CTP\_ERROR. When controlling the step motor with speed sensor (CTP\_BASE 1), the position is controlled by him. The active edge of input clock controller stores the current value of steps. If joystick position is outside DeadZone limits from the central position a movement with speed, defined by the joystick DeadZone edge to 100% deviation, begins. Joystick positions inside DeadZone limits correspond to zero speed (soft stop of motion) and positions beyond Low and High limits correspond MaxSpeed [i] or -MaxSpeed [i] (see command SCTL), where i = 0 by default and can be changed with left/right buttons (see command SCTL). If next speed in list is zero (both integer and microstep parts), the button press is ignored. First speed in list shouldn't be zero. The DeadZone ranges are illustrated on the following picture.  The relationship between the deviation and the rate is exponential, allowing no switching speed combine high mobility and accuracy. The following picture illustrates this:  The nonlinearity parameter is adjustable. Setting it to zero makes deviation/speed relation linear.
